

Things that can be concluded through graph

① Shape of the distributⁿ:

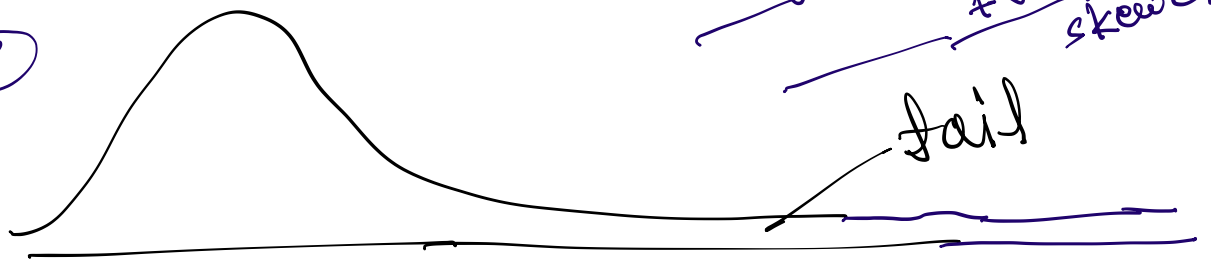

Ⓐ Symmetric distributⁿ: The left and right side of the graph are mirror images

mode = mean = median

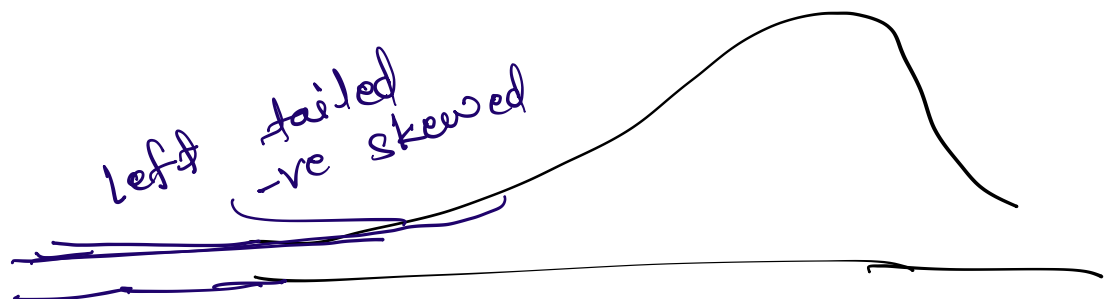

Ⓑ Skewed distributⁿ:

no
i

Right tailed
+ve
skewed

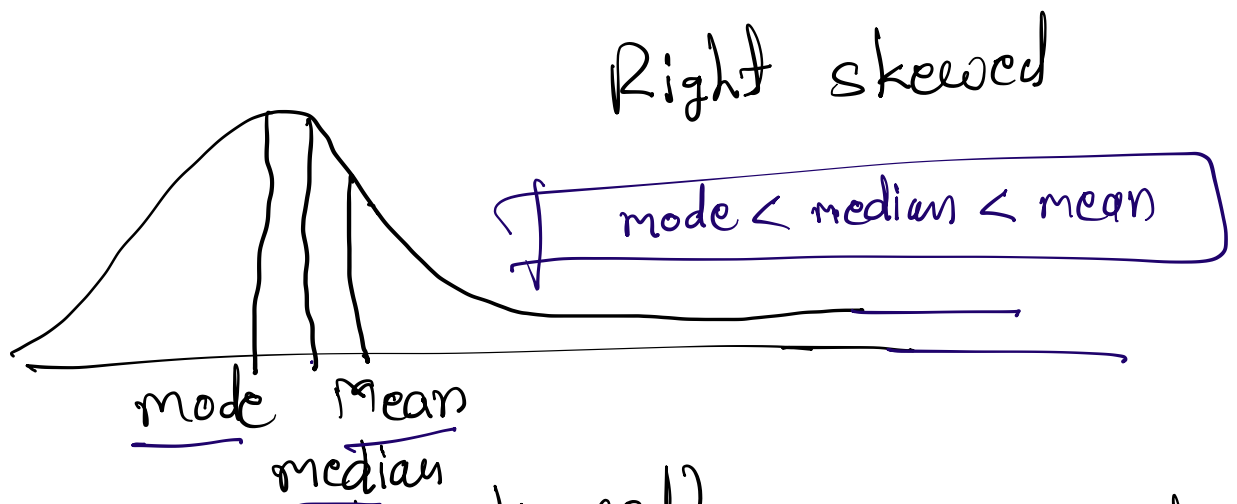

no
ii

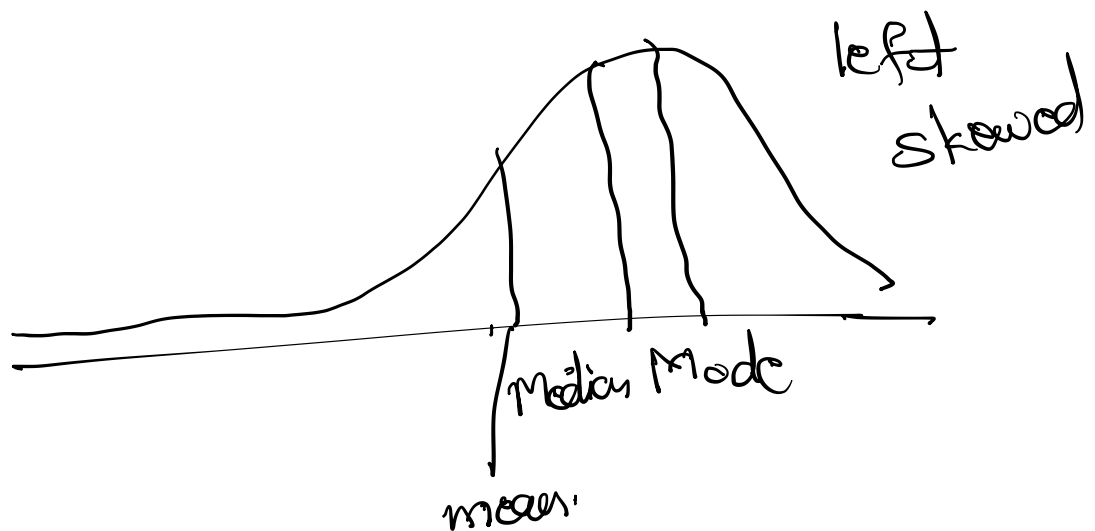

left tailed
-ve skewed

(Positive skewed)

(i) Right skewed: Tail extended to the right side

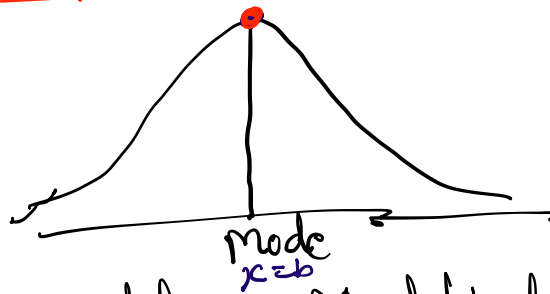

(negative skewed)
(ii) Left skewed: Tail extended to the left side.

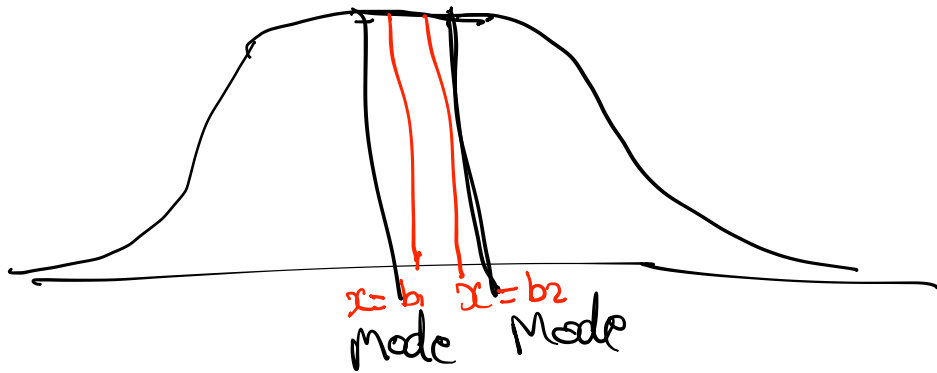

② Modality:

① Unimodal: One clear peak ✓

→ $x=b$ is mode

② Multi modal: Multiple peaks

③ Kurtosis: (Peakness)

① Leptokurtic: Taller and sharper peak with fatter tails

② Platykurtic: Flatter peak with thinner tails

③ Mesokurtic: moderate peak.
